

A prompt works best as one continuous block of text, broken into labeled sections. Skip a section and the output tends to fail in a specific, predictable way.

GLOBAL STYLE comes first: genre, color grade, film stock or digital look, aspect ratio, shutter behavior, and anything that shouldn't appear. Everything after this section needs to match it.

SCENE is a one-line logline, what's happening, where, in what mood. Save the detail for later sections.

CHARACTERS describes every person in the shot: face, hair, build, wardrobe. If a reference image already covers this, just note which reference is which character.

LOCATION covers the space and its props, separate from the people in it. A vague location is the most common reason a multi-shot sequence starts drifting between cuts.

FIRST FRAME AND BLOCKING pins down exact starting positions, who's where, facing which direction, right as the clip begins. This gives the model something fixed before any motion starts.

The shot-by-shot breakdown comes next, each one labeled "Shot 1", "Shot 2", and so on, with the shot type and action in a sentence or two, ending in "Hard cut" wherever a cut belongs. Pacing gets built here, not in a separate field.

OPTICS and CAMERA describe the lens and camera movement for each shot: focal length, camera height, handheld or dolly or crane.

PHYSICS covers how fabric, smoke, hair, and liquid should move, anything that would look off moving like a solid object.

LIGHTING goes further than GLOBAL STYLE on the light source: where it's motivated from, its direction, how it falls on faces or surfaces.

AUDIO comes last: ambient noise, specific sound effects, and what shouldn't be there, usually "No music, no discernible dialogue" unless the scene needs otherwise.

Most working Seedance 2.5 prompts follow the same shape: one visual rule at the top, one sound rule at the bottom, and everything in between broken into shots.
